It is provided in a specification felating to compounds for immunotherapy and diagnosts of breast cancer, breast tumour entigens and the polynomials that encode them may be used in the production of a pharmaceutical composition to be used in the treatment of breast cancer. Frollierated Toolls and incubated antigen presenting cells are also required. The polypeptides and polynocleotides may also be used to produce a raccine.

actived from the 5' ends of maths and even in those cases where longer cDAN sequences have been obtained, the full 5' UTR is rarely included.
5' ESTS are derived from makes with thotat 5' ends and can therefore be used to obtain full length cDNAs and genome DNAs. 5' ESTS are also used to obtain full length cDNAs and genome to DNAs. 5' ESTS are also used to distance the sequence of the sequences and the sequences and to design expression and secretion vectors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                D
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5 B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              da
The present sequence is one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTS were prepared from total human RNAs or polyA- RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from olivo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences

The invention relates to nucleic acids encoding NOVX (k being an integer from 1-8) polypeptides. The NOVX nucleic acids and polypeptides are useful in diagnosing, treating or manufacturing a medicament for a dissase or disorder associated with NOVX expected as medicant no (cancer and diabetic returopathy), anglogenic or pulmonary disorders, fertility
                                                                                                               Nucleic acids encoding polypeptides, designated NOVX polypeptides, useful for treating a syndrome associated with a NOVX-associated discrete, e.g. cell proliferation (e.g. cancer and disbetic retinopathy), angiogenic or pulmonary disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human: NOV6: ds: 78347267; fertility disorder: spermatogenesis; cardiant: cytostatic; immunomobulatory; entiproliferative; antidiabetic; cell proliferation; cencer; diabetic retinopathy; angiogenic disorder; pulmonary disorder; nacmotopietic disorder; immunological disorder; inflammatory disorder; tumour related disorder; emphysema; cirricosis; wound healing; gene therapy.
                                                                                    Disclosure: Page 22-30; 144pp; English.

អនុស្សស្ត្រស្ត

disorders (e.g. of spermatoyenesis), hematopoietic, imminisperia, citrin.sis, which inflammatory and tumbur related disorders, emphysema, citrin.sis, which healing, NOVA nucleic acids are also useful in gene therapy. They are also useful for screening for a modulator of activity or interapy. They are also useful for determining the presence of or predisposition to a NOVA-associated disorder. The present seyuence contains the year for NOV6 (78847267), which has sequence homology to interleukin a.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relate to the isolation of genes AkC59157-C59205 encyding 49 human secreted proteins AAB27682-827730. The genes can be used to generate fusion proteins by linking to the gene for the human immunoglobulin G Fc portion for increasing the stability of the fusion protein as compared to the human protein only. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification, the nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosts, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Movel human secreted proteins useful for diagnosis, prevantion treatment of disorders including neurological, cell proliferaticardiovascular, autoimmune/inflammatory disorders and microbial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         12-MAR-1999;

Adams MD, Moreno RF, Venter CJ;

Enricia digonuclectides and corresp, sequences - used markers for human genes transcribed in vivo, facilitate of most human genes

as tagging

Example 4; Page 207; 500pp; English.

The Expressed Sequence Tag was isolated from a human brain cDNA library as part of a large set of ESIS which can be used as markers for human genes transcribed in vivo. They can be used to facilitate tagging of most human genes, for mapping locations of expressed genes can chromosomes, for individual or forensic identification, for mapping locations of disease associated genes, for identification of tissue type, and for preph. of antisense sequences, probes and constructs. ESTU153 has a "poor" coding probability as evaluated using the coding-region prediction program CRM. See also AAQS9041-061440.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5
                                                              The present sequence is the coding sequence for a human PRO polypertial (secreted and transmembrane). The PRO protein, and PRO agonists, FRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to protein agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRO coding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping.
                                                                                                                                                                                                                                                                                                                                                                           Claim 2; Fig 129; 278pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Eighty four nucleic acids encoding PRO polypeptides ...setul molecular biology, including use as hybrivization proces, archromosome and gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  BP; 272 A; 307 C; 226 G;

AADU5579-AADU5556 represent chiks corresponding to 28 human secreted protein genes and AADU1770-AADU1849 represent the proteins they encourable protein genes and AADU1770-AADU1849 represent the proteins they encourable proteins are useful for preventing. The genes and their secreted proteins are useful for preventing, treating and tail granting medical conditions, e.g., by protein or generating perfecting and tail conditions, e.g., by protein or generating perfection in a sample or by determining the presence of mutations in the new genes, packific uses are described for each of the about to the new genes, packific uses are described for each of the about the new genes, the presence of the pre

ce abnormalities, haumatopoiette disorders, diseases of the interme system, AIDS, autoimmune diseases (w.g., rhematoid arthritis), initialmation. AIDS, autoimmune diseases (w.g., rhematoid arthritis), initialmation. Ce alteries, neurological disorders (e.g., Milheimar's diseases, established as schizohrenia, astinna, parkinson's disease), comitive disorders, schizohrenia, astinna, ce skin disorders (e.g., psorialsis), sepsis, diabetes, atheroscierosis, cardiovascular disorders, angiogenic disorders, atheroscierosis, cardiovascular disorders, angiogenic disorders, atheroscierosis, compatent standard and compatent disorders, and infections. The proteins can also be used to alid wound chealing and epithelial cell proliferation, to prevent skin aging due to culture of primary tissues, to regenerate tissues, to deprify their compate ligands or binding partners, and in chemotaxis, and can be used to as a food additive or preservative to monify storage properties.

Cantibodies specific for a protein of the invention can be used in diagnostic immunosorbent assay (ELISA). The present sequence represents a human considerated with the disorders mentioned above, and cinamonosorbent assay (ELISA). The present sequence represents a human exception of the invention can be used to secreted protein-encodiny cDNA of the invention.

CC ALGO5579-AADD5656 represent cDNAs corresponding to 28 human secreted protein genes and AADD170-AADD1867 represent the protein they encode. AADD1866-AADD1866 represent human secreted protein fragments of variants. The genes and their secreted proteins are useful for preventing. Creating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the abount of the new genes. Specific uses are described for each of the CC amutations in the new genes. Specific uses are described for each of the CC and include developing products for the diagnosed by the presence of proliferative disorders, cancer, tumours, foctal and developmental proliferative disorders (e.g., rheunatoid arthitis), inflammation, albey and proteins are most highly expressed. Albey autonomic diseases (e.g., rheunatoid arthitis), inflammation, albey and a secondary disorders, callergies, neurological disorders (e.g., rheunatoid arthitis), inflammation, albey as a neurological disorders, sepsis, disbetes, artherosclerosis, callergies, and infections. The proteins can also be used to said wound constitute this orders, pregnancy related disorders, endowed the subdurf, to maintain organs before transplantation, for supporting due to subdurf, to maintain organs before transplantation, for supporting due to contain a protein contain subsective the subdurf of the invention can be used in an indicating symptoms associated vith the disorders mentioned above, and contained subvected vith the disorders mentioned above, and contained subvected vith the disorders mentioned above, and contained subvected vith the disorders mentioned above, and contained contained

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a fragment of the genomic sequence containing the coding region for the mouse KRN gene (AAX83001). The corresponding human gene (AAX83001) encodes a protein related to Werner's Symdiome. The products can be used for the detection and treatment of Werner's syndrome (M3), an autosmal recessive disorder with a complex phenotype, as well as related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1; Fig 7; 153pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to human single exon humble acid probes (SEMP). The present sequence is one such probe. The SEMPs are derived from human hetac cells. The SEMPs can be used to produce a single exon microarray, which can be used for measuring human gare expression in a sample derived from human cervical epithelial cells. By measuring yene expression, the probes are therefore useful in grading and/or steping of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from Wifel at fip.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                        probe; microarray: human; placenta; antenatal diagnosis;
genetic disorder; ss.

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells -

Claim 25; SEQ ID No 6466; 487pp; English.

The present invention relates to human single exon nucleic acid probes (SEMP). The present sequence is one such probes. The SEMPs are derived from human Hela cells. The SEMPs can be used to produce a single exon nicroarray, which can be used for measuring human gene expression in a sample defived from human cervical epithelial cells. By measuring pane expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIFO at tip.wipo.int/pub/published\_pct\_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        17-OCT-2001 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAI39509;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAI39509 standard;
                                   The present invention relates to single exon nucleic acid probes (SEAr). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placents. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                          (MOLE-) MOLECULAR DYNAMICS INC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            30-JAN-2001; 2001WO-US00663

                             cc present sequence is human glycosyl sultotransferase-6 (GST-6)
cc percent DNA
cc percent suppe 2 meatrane protein useful for inhibiting a Linding e.e.f.
cc GST is a type 2 meatrane protein useful for inhibiting a Linding e.e.f.
cc between a selectin and a selectin light, which comprises contacting the
cc selectin with a non-sulphation activity of GST and a small molecular
cc agent that inhibits the sulphation activity of GST is also useful
cc agent that inhibits the sulphation activity of GST is also useful
cc in inhibiting a selectin mediated Linding event. GST is also useful
cc in inhibiting a selectin mediated Linding event. GST is also useful
cc in inhibiting a selectin mediated core chronic inflammation.
cc therapy to treat disorders such as acute of chronic inflammation.
cc incluse, polymyositis, dermatcupyositis, systemic salutoris, diabetes.
cc incluse, polymyositis, dermatcupyositis, systemic salutoris, diabetes.
cc glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Hashimoto's
cc disease, Grave's disease, actematitis, hypocranthyroidism, permicious
cc anaemia, demyelinating diseases, cirrhosis, ulcerative collitis,
cc syndrome, infantile eczena, psoriasis lichen planus, aliergic rhinitis.
cc bronchial asthma, hypocrasnsitivity, rheumatic fever and tissue rejection

Claim 1; Page 103-141; 155pp; English. screening for compounds which bind to the receptor proteins

Ten new offactory receptor proteins and their biallelic markers have teen described. The sequences encoding these receptor proteins and which contain the biallelic markers can be used for genotyping. The olfactory receptor proteins can be used to screen for substances which bind to them. See GENESED records AA253816:25 and AAY83386-95.

G 93466, sby2, 93017 and 935018 mucleic acid sequences located on the
Chuman chromosome 193119 locus. The nucleotide sequences contain
C biallelic markers and polymorphisms. Sequences AAH51602 AAH51620 AAH51631 represent cDNA human sbyl cDNA sequences and protein
C products. AAH51627 AAH51631 and AA562916 AAH51652 AH481652 are used
C to isolate sbyl cDNAs, while sbyl exons from different primates are
C tropresenced by sequences AAH51622 AH81669 Nucleotide sequences of
C amplicons which comprise biallelic markers located on the chromosome
C 1331-131 locus are represented in AH51700 AH81617. Hallelic marker
C are represented by adjunces by degenerate/undafined base codes. PCR
C tropresented in the sequences by degenerate/undafined base codes. PCR
C are represented in AH518181 are used in the isolation of sequences are
C used to determine the identity of the nucleotide at a biallelic marker in
C a sample DNA sequence. The nucleotide sequences may be labeled and used
C a sample DNA sequence. The nucleotide sequences may be labeled and used
C a sample DNA sequence. The nucleotide sequences are considered by determining the identity of the sucleotide at a biallelic marker in
C population an association between a genergy of a biallelic marker in a protein of the disorder or a beneficial response to or side cifects related to
C used to determine a predisoposition to or early onset of schizophrenia or
C used to determine or or a beneficial response to or side cifects related to
C treatment against schizophrenia or bipolar disorder.

No ORF has yet been conclusively identified within the present sequence. The 5 ESTS were prepared from the present sequence. The 3 ESTS were prepared from the present sequences usually correspond mainly to the 3 unitaristated region (UTR) of the mRNA because they are often obtained from obtained romalized region (UTR) libraries. Such ESTs are not well saited for isolating cDNA sequences they been obtained, the full 5 UTR is rarely included. 5' ESTS are derived from mRNAS and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTS are derived from mRNAS with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAS. 5' ESTS are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                  Human; calcium sensitive potassium channel; beta2 subunit; asthma; beta3 subunit; diabetes; chromosome 193-ter; inhibitor; activator; glaucoma; migraine; angina; irritable bowel syndrome; Alzhelmer's disease; ds.

                                                                                                                                                                                                               The present invention provides the protein and coding sequences of the human calcium sensitive potassium channel beta?, beta3, beta3 beta3b, beta3f activators in these can be used to identify inhibitors and activators of the channels, which can be used in the treatment of conditions including astima, disbetes glucoma, cerebral ischaenia Alzheimer's disease, excessive smooth muscle tone, angina, hypertember incontinence, migraine and irritable bowel syndrome. The coding sequences are found at ruman chromosome 323 tter. The present sequence is the beta3 subunits coding sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21-AUG-2001 (first entry)
This invention relates to the present sequence which represents a look fragment of the long arm of human chromosome ldq. The sequence includes the 18q interval associated with neuropsychiatric disorders (unclavidus 28441-1444)9). Included in this region is the fsh2 gene, which is involved in neuropsychiatric disorders. Included in the invention arc
                                                                                                                                                         Claim 1; Fig 1B; 153pp; English.
                                                                                                                                                                                                         Nucleic acids encoding mammalian rsh25 polypeptides ussociated with neuropsychiatric disorders, useful for treating e.g. bipolar affective disorders.
                                                                                                                                                                                                                                                                                                            WPI; 2001-308772/32.

Claim i; Fig 1B; 174pp; English.

The present sequence is a 116 kb fragment located between markers CR abbiect22 and Bablecapi from human chicaccame 184, This sequence includes the 164 interval associated with neuropsychiatric disorders, located from positions 26441-144419. This sequence also contains a novel gene: 184.20 capae. The sinh5 gene is associated with bipolar affective disorder (BAD) and the present sequence or its fragment analog or minetic is useful for treating a fish5-related disorder: 54; or manic-depressive illness) in contains. The present sequence or its fragment analog or minetic is useful for treating a fish5-related disorder or ish5-mediated process in a cannal, such as neuropsychiatric disorders with as schloophrenia.

CR alterial such as neuropsychiatric disorders such as schloophrenia.

CR disorder and unipolar disorder. Also, neuropsychiatria disorder bipolar affective disorder bipolar affective disorder bipolar affective disorder bipolar affective disorder. Such as a schlophic lateral scherosis, and Parkinson's disease, as vell as Gilles de la curette's syndrome, autonomic function disorders such as hypertension cand sleep disorders can be treated.

                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a 150 kb fragment of the long arm of chromosome 18. This region is associated with neuropsychiatric disorders, and contains the fishal gene and markers subject2 and BAD18649. The fishal gene is a gene involved in bipolar affective disorder (BAD). The fishal polyniciatides and polypeptides are used to detect, modulate, or reast chromosome 18g related disorders are used to detect, and the subject of the first polynemia, attention deficient disorder; a schizopared attention deficient disorder, a schizopared can be used to identify an individual having or at risk of developing one of the disorders. The fishal gene and derived polynicipations can be used to identify a compound capable of modulating fishal activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BAD18cagl marker; fsh28 gene; bipolar affective disorder; BAD; chromosome 18; chromosome 18q; neuropsychiatric disorder; schizophrenia; attention Jeficient disorder; schizoaffective disorder; unipolar disorder; BAD18ct22 marker; ss.

Arachidonic acid metabolism related genomic biallelic marker #525

```
Sequences AAF93180 - AAF93741 represent polynucleotide sequences encoding human SRI proteins. The cDNA sequences are isolated from various CC different human tissue cDNA libraries. The invention relates to a method of iferent human tissue cDNA libraries. The invention relates to a method conding SRI, a host cell transformed with the vector containing cDNA. CC encoding SRI, a host cell transformed with the vector, an isolated SRI colyopepide, and an anthody which binds to SRI. The polynucleotide sequence can be used in gene therapy and is useful in the recombinant production of SRI polypepides, as a hybridisation probe to screen composition of SRI polypepides, as a hybridisation probe to Sereen colors to isolate cDNAs with sequence identity to SRI polypepides, to a libraries to isolate cDNAs with sequence itssue detection. The SRI collisorders, tissue typing and disease tissue detection. The SRI collisorders, tissue typing and disease tissue detection. The SRI collisorders, tissue typing and disease tissue detection. The SRI collisorders, tissue typing and disease tissue detection. The SRI collisorders, tissue typing and disease this reaction.
                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid molecule encoding a SRT polypeptide is for production of recombinant SRT polypeptides, gene mapping, diagnosing genetic disorders and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                     Claim 2: Fig 457; 663pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             or markers derived from genes involved in atscribes including tiallelic markers derived from genes involved in atscribation and markers derived from genes involved in atscribation and markers derived from genemic regions flanking those genes, wethods from the present convention may be used to select individuals for clinical trials and predict responses to treatment with drugs. In polymacleotides may be used in bybridisation assays, sequencing assays and specific marker (EBBM) or 12-10-related biallelic marker and for amplifying a segment of nucleotides constituing an elosanois-related biallelic marker (EBBM) or 12-10-related biallelic marker, and for amplifying a segment of nucleotides constituing a marker (EBBM) or 12-10-related biallelic marker, and for amplifying a constituent of the markers may be used to detect conditions constituent of the markers may be used to detect conditions and genotypes associated with arachiants and an elaboration and penotypes associated with arachiants and an elaboration and the ceremonity of the present invention.

OR M.B. Polymarphic bases (single nucleotide polymarphisms also known as the polymorphic bases (single nucleotide polymarphisms also known as constituted programment invention have been given as their corresponding degenerate bases e.g. a polymorphic base of C or T has been given as X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match 2.34; So

Claim 7; Fage (15-123; 133pp; English.

The present separation and alternative version of a cDNA encoding C2 7875 protein, a miman ADAM-TS (a disintegrin and metalloproteinase). The capturation, protein degradation, tumbur growth, metalsais and C2 capturation, protein degradation, tumbur growth, metalsais and C3 capturation, protein degradation, tumbur growth, metalsais and its C3 antitudates are usually for preventing, dispinosing and treating C2 antitudates are usually for preventing, dispinosing and treating C3 include, disorders involving the luma such as congenital anomalies. C3 include, disorders involving the luma such as congenital anomalies. C4 disorders involving the skeletal muscle include tumours such as bronchial astlam, coopsasture's synorame, pulmonary alveolar proteinosis. C4 disorders involving the skeletal muscle include tumours such as capture such as theroscies involving the skeletal muscle include tumours such as capture and storders involving blood vessel such as hypertension, captured the state and geldidynis such as onespecific epidolymitis and crecities, paper structure, disorders and syphilis, spermatocytic seminours put the testis and geldidynis such as onespecific epidolymitis and crecities, paper sinvolving the kidney such as membrangoroliferative c3 captacosis, circuit glomerulonephrittis, sicke cell disease rephropatry, carlocals, circuit glomerulonephrittis, sicke cell disease rephropatry, carlocals, capture solution, osteonar come, metastatic tumours, call disorders involving thymus such as athomatory tumours, and disorders involving thymus such as trymic bypoplasia. C5 captures shown in Fig 1 (See ADO4494), However these sequences ditter at several locations.

```
The present sequence is a cDNA emining 27875 protein, a human ADAN-IS CC (a disintegrin and metalloprotein:se). Metalloproteinse is a proteolyptic earyme involved in purchin maturation, protein degradation, cc tumour growth, metastasis and analysagenesis. Nucleotides encoding 27875.

CC 27875 protein and its antibodies are useful for preventing independency include, disorders involving the include suseful for preventing independency considers involving the include suseful for preventing alveolar proteinset for an artificial stifma. Goodpasture's a mature trailure, cardiac hypertrophy.

CC disorders involving the stellar involving the preventing at recolar proteins. The disorders involving the stellar involving the stellar involving the stellar involving the trailure associated with other disorders disorders involving the testis and epididy, as such as nonspecific epididymitis and cribitis, somerine, mumps, tuther disors as sphills, spermacocytic glomerulophritis, percetsing involving such as another alsorders involving the stellar involving
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; ADAM-TS; A Disintegrin And Mctalloproteinase; antiinflammatory; andylogenesis; bronchial asthma: "... The present invention provides inhibitors of histone descriplase enzy, such as HDAC-1, HDAC-2, HDAC-3, HDAC-3, HDAC-4, HLAC-5, HDAC-C and HDAC-D This inhibitors may be antisense strands or they may be compounds identification of the enzyme with the compound and measuring the resulting concerts and identify, these inhibitors are useful for treating cancers and identifying which histone deacetylase is involved in a neoplasia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is one of a large number of 5 ESIS derived from CC mRRAS encoding secretch proteins. No ORF has yet been conclusively conclusively in the present sequence. The 5 ESIS were prepared from CC total human RRAS or polyar RNAS derived from 30 different tissues. ESI CC sequences usually correspond mainly to the 3 untranslated region (UTR) CC of the mRNA because they are often obtained from ollyor off primad cDNA CC libraries. Such ESIS are not well suited for isolating cDNA sequences (CC derived from the 5 ends of mRNAs and even in those cases where longer CC derived entry because they are often obtained. The full 5 UTR is rarely included. CS 5 ESTS are dot DNAs and appeare 5 ends of mRNAs with intext 5 ends and can therefore be CC used to obtain full length cDNAs and spannic DNAs. 5 ESTS are also used CC used to obtain full length cDNAs in a spannic by DNAs. 5 ESTS are also used CC in diagnostic, forensic, gene therapy and biromosome mapping procedures. CC They are used to obtain out to obtain unit of the procedures and contains and secretion vectors.

A AAA42265 to AAZ43075 represent novel 5' expressed sequences tay (EST) sequences, corresponding to human secreted proteins. AAX6451 to AAX43052 the AAX64318 represent the EST-related proteins corresponding to AAX42265 to CAAX643052. The 5' ESTs can be used for producing secreted ...man gane corresponding to the AAX43052 they can be used to identify and isolate 5' untranslated regions (UTRs) and upstream regulatory regions which control the correct development stags, rate, and quantity of protein synthesis, as the correct development stags, rate, and quantity of protein synthesis, as covell as stability of mRMA. The ESTs are also useful as proteins for control comes mapping, and to obtain full length colk clones. The ESTs can disposite procedures to identify individuals having genetic diseases of the common sequences and the dentify individuals having genetic diseases cresulting from abnormal gene expression. The products may also be used in common sequences are perfectly of the colds encoding signal peptides on the close tracting a variety of human conditions. Secreted proteins the control of the proteins according to the conservation of a polypeptide of the insertion of a polypeptide into a membrane, or importing a polypeptide content of the proteins according to the conservation of a polypeptide of the proteins according to the conservation of a polypeptide conservation of a polypeptide of the proteins according to the conservation of the proteins according to the content of the proteins according to the conten
                                                                                                                                                                                                                                                                                                                                                                                                                            Owery Match 2.2%; Score 22; DB 21; Length 31; Best Local Similarity 100.0%; Prod. This sequence represents a wheat indole-3-glycerol phosphate synthase controlled to the biosynthesis of tryptophan. Plants are able to synthesise convolved in the biosynthesis of tryptophan. Plants are able to synthesise carlain anno acids, unlike vertebrate animals, which require controlled the manno acids (essential amino acids) in their diet as they cannot mannifecture them de novo. Tryptophan is one such essential amino acids (essential amino acids) in their diet as they caid, in plants, the biosynthesis of tryptophan is one such essential amino acid. In plants, the biosynthesis of tryptophan from chorismic acid requires five enzymatic steps catalysed by anthranilate synthase. Considerate, including the phosphate synthase and tryptophan synthase. Considerate, including the hormone insole-3-acetic acid, antimicrobial tryptophan biosynthetic enzymas may be used to generate transpanic content or those which cannot synthesise tryptophan biosynthetic enzymas is altered, including plants having an increased tryptophan content or those which cannot synthesise tryptophan (loss of function mutants). Content or those which cannot synthesise tryptophan (loss of function mutants). Content or specific inhibitors which may be potentially useful as herbicides. As these enzymes are involved in a biosynthesis path-sy that does not exist content or inhibitors which may be potentially useful as herbicides. As these enzymes are involved in a biosynthesis enzymes are succession or exist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cahoon RE, I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A A The present invention describes primer sets for synthesising 5602 CG full-length cDNAs defined in the specification. Where a primer set comprises: (a) an Oligo-dl primer and an Oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 560 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of a polynucleotide which complementary to the complementary strand of a polynucleotide which complementary to the complementary strand of a polynucleotide which complementary to a polynucleotide which comprises a 5-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 5-end sequence. Where the combination of the 5-end sequence/3-end sequence is selected from those defined in the 5-end sequence/3-end sequence is selected from those defined in the primer are useful for synthesising polynucleotides. The primers are useful for synthesising polynucleotides of the grection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDMAs. The primers are also useful for the comprise of the full-length cDMAs. The primers are also useful for the AMI1562 and CC AMI15631 to AMI1742 represent human cDMA sequences; AM592416 to AMI15632 compresent human annual acid sequences; AM592416 to AMI15632 compresent human acid sequences; AM592416 to AMI15632 compresent hu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                 The nuclectide sequence of an 8654 Lp probe obtained by digestion of Staphylococcus epidermials genomic DNA with the restriction enzyme Hindlll. The probes (AAQS5131-48 and AAQS5132-50) represent other probes derived, by Hindlll digestion of the genomes of Saureus, Spidermis, Enterococcus faccalis, Fseudomonas aeruginosa, E.coll, Slabisabla penumoniae or Enterobacter cloacae. The probes can be used to detect their respective microorganisms in clinical samples.
                                                                                                                                                                                                                                                                                                                                  Probe for identifying betteria causing infectious disease consists of a DNA fragment obtained by Hindill cleavage of pathogenic tacterial genomic DNA
                                                                                                                                                                                                                                                                                                Claim 4; Page 30-35; 100pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to novel genes (AAI62752-AAI62961) and proteins (AAM2317-AAM42415) useful for preventing, treating or ameliarating conditions e.g. by protein or gene therapy. The genes are called conditions e.g. by protein or gene therapy. The genes are called from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful cand ovarient cand other cancers of the adrenal gland, bone, bone and ovarient cand other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract. Ever, lung, or urogenital: (b) immune disorders e.g. Addison's disease, allergies, autoimmune the manufacture of the adventure of the adventure of the selection's colities; (c) cardiovascular disorders such as myocardial isothemas; (c) cardiovascular disorders such as myocardial isothemas; (c) disease, multiple sclerosis, rheumatoid arthritis and ulcerative colities; (c) cardiovascular disorders such as myocardial isothemas; (c) disease, in firetious diseases such as viral, bacterial, fungal content and parasitic infections. Infectious diseases such as viral, bacterial, fungal content passitic infections, but was obtained in electrooic format directly from Wife at fip.vipo.int/pub/published_pcr_sequences.

This is the numan cell stress regulated MHC class I chain-related gene A (MICA). It was obtained from sligle-stranded (MUI) and double-stranded (MUI) templates of mapped or randomly shot-yan subcload DNA fragments that were derived from cosmid MIA. The game is located 40 kb centromeric of HIA-B. It codes for a 385 amino acid polypeptide (see AAM6004). A chik clone (see AAV34456) coding for closely-related MICB (see AAW60041) is also provided MICA and MICB are specifically expressed at the lining of the gastrointestinal tract, the primary site of infectious attack, and a major target for complications arising from graft-versus host disease (GVHD). They are also expressed at the cell surface of

cc colon and other cancer cells. A claimed method of detecting a calcied are methods of purifying, enriching and expanding voeta 1 craimed are methods of purifying, enriching and expanding voeta 1 craimed are methods of purifying, enriching and expanding voeta 1 craimed are methods of purifying, enriching purified Troells. Cc method of increasing expression of HICA or HICE pulyepides, a cc method of increasing expression of HICA by providing a cell with cc an expression construct comprising a HICA coding region under the Cc control of a promoter active in entaryotic cells, and a transgenic Cc animal expression MICA and/or HICE. A therapeutic agent (e.g. animal expression MICA and/or HICE. A therapeutic agent (e.g. a toxin or cytokine) conjugated to a HICA or HICE-hidning agent CC (e.g. antibodies) can be used for the detection and treatment of C concers such as brain cancer, lymphatic cancer, leakamia. Cc combandoma, head and neck cancer, ossophageal cancer, colon cancer. Cc melanoma, head and neck cancer, oversian cancer and creatment of other disorders such as CVHD and inflammatory boxel colleges.

```
cc scretch duman protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene can be used to come it is compared to the human protein only. The gene can be used to come a compared to the human protein only. The first instance is acid sequences: ANV3145, 79476, amino acid sequences: ANV3154-79476, amino acid sequences ANV3155-795176; conditions can be disquested by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the completions of the new polypuches in a sample or by determining the amount of the completions in the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the amount of the new polypuches in a sample or by determining the new polypuches in the new polypuch
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           22-AUG-1997;

: covel isolated polypeptide comprising an immunogenic portion of a cleast cancer protein useful in the detection and treatment of breast cover.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..an: Dreast tumour antigen; Cylostalic; immunotherapy
Least Cancer; Vaccine; ss.
The present sequence was isolated from a presst tumour cDNA library. It a provided in a specification relating to compounds for immunotherapy and diagnosis of breast cancer. Breast tumour antigens and the injunction of the used in the preduction of the used in the treatment of breast cancer. Soliferated composition to be used in the treatment of breast cancer. Soliferated peells and incubated antigen presenting cells are also equivalence a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               J-APR-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides the protein and coding sequences of a number of colorectal cancer antiques. These are shown in the AA157547-AA157549 and AA438565-AA436641. These can be used in the diagnosis, prevention and treatment of cancer of the colon and/or rectum. The present sequence is a colorectal cancer antiqen general sequence. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from HIFO at fip.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated polypeptide for treating, preventing and/ or progressing disorders related to the colon and rectum including colorectal cancers and also for testing and detection e.g. diagnosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ĸ
```

The present invention provides the protein and coding sequences of a number of colorectal cancer antigens. These are shown in AAISTS47-AAISTS41. These can be used in the disquests, prevention and treatment of cancer of the colon and/or rectum. The present sequence is a colorectal cancer antigen coding sequence of the invention.

The invention are the colorectal cancer antigen coding sequence of the invention.

The sequence data for this patent did not term part of the printed specification, but was obtained in electronic format directly from WIFO at fig.-VIPO-int/pub/published\_pot\_sequences. Sequence 629 BP; 244 A; 94 C; 79 G; 212 T; 0 other;

                                                                                                                                                                                                          The invention relates to movel genes (Ahhö)77-Ahfijii) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is affilicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene thorapy.
                                                                                                                                                                                 Sequence 468 BP; 121 A; 80 C; 95 G; 168 T; 4 other;
                                                                                                                                                                                                                                                                                                                                          Claim 1; Page 120-121; 1051pp: English.
                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer .

                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel genes (AMH6877-AMH7383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a pre-malignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for industring cervical cancer in a patient. The nucleic acids may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                            Sequence 543 BP; 134 A; 103 C; 117 G; 189 T; 0 other;

48 human secreted proteins AABS2104-BS2180. The genes can be used to generate fusion proteins AABS2104-BS2180. The genes can be used to generate fusion protein so y linking to the gene for the human (Immunoylobulin G FC portlon (SEQID) for increasing the stability of the fusion protein as compared to the human protein only. The genes and proteins are useful for preventing, amaliorating or treating medical conditions, e.g. by protein or gene thrappy. The genes are isolated from a range of human tissues disclosed in the specification. The diagnosis treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the address gland, bone, bone and ovarian cancer, and other cancers of the address gland, bone, bone amonytic anaems, autoimment thyroiditis, diabetes mellitus, Crohn seconds, autoimment thyroiditis, diabetes mellitus, Crohn seconds, (c) cardiovascular disorders such as mycoardial ischaemias; (d) cond healing; (e) neurological diseases e.g. cerebral aroxia and condition infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The gene number, and the clone: it is evided from, are detailed in the descriptor line. The gene can be used to compared to the protein so proteins by linking to the gene to a human immunoglobulin of protein as compared to the human protein only. The invention relates to 70 novel genes and their fragments (nucleic conditions are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy and their fragments (20 which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, path. Joylcal conditions can be diagnosed by determining the amount or the new polynucleotides. Specific uses are described for each of the 70 culture and proteides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 70 culture and proteides in season of the new polynucleotides. Specific uses are described for each of the 70 culture from the first proteid of the 70 culture fragments of the 70 culture fragments of the first proteids in a sample or the first protein or described for each of the 70 culture fragments.
                                                                                                                                             Query Match

Also, pathological conditions can be diagnosed by determining the amount of the new polyproptides in a sample or by determining the presence of mutations in the new polyprolectides. Specific uses are described for each of the 70 polyprolectides, based on which tissues they are most highly expressed (see AAV34154 for described uses).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ij
```

This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immanoglobulific portion (e.g. ANVA145) for increasing the stability of the fused protein as compared to the human protein only.

Section of the second

New isolated human genes and the secreted polypeptides they encode - useful for diagnosts and treatment of e.g. cencers, neurological disorders, immune diseases, inflammation or blood disorders

Claim 1; Page 234-235; 447pp; English.

```
This sequence represents a nucleic acid molecule which encodes a screteed himan protein. The game number, and the clone it is derived from, are detailed in the descriptor line. The game can be used to generate fusion proteins by linking to the game to human immunoglobulin CC Fc portion (e.g. ANV3145) for increasing the stability of the fused CP protein as compared to the human protein only.

CC The invention relates to 70 novel genes and their fragments (nucleic acid seguences: ANV31454 vy14276; amino acid sequences ANW5057-475179) which are useful for preventing, treating or ameliorating medical CC conditions e.g. by protein or gene therapy. Also, pathological CC conditions can be diagnosed by determining the amount of the new polynucleotides. Specific uses are described for each of the 70 CC the new polynucleotides. Specific uses are described for each of the 70 CC polynucleotides. Specific uses are described for each of the 70 CC polynucleotides based on which tissues they are most highly expressed in CC (see ANV31154 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ouery Match 3.7%; Score 22; DB 19; Length 1108; Best Local Similarity 10.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A mutant IR is claimed which may have a mutated alpha-chain, esp. at the precursor processing site. The beta-chain may be mutated, e.g. by deletion of the transmembram sequence; the tyrosine kinase activity may be inactivated. Fig. 5 is a comparison of oncogene and human EGF receptor sequences with that of HIR in the cytoplasmic domain of the insulin receptor beta subunit.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes the coding and protein sequences of the human kinesin-like protein iRLP. It is thought that the protein could be involved in neurological disorders, infortility, spontaneous abortion, neonatal chromosome disorders, aneuploidy and cancers. This is due to its function in the movement of microtubbles. The protein shows homology to the murine KIFIA and KIFIB proteins. The sequences disclosed in the invention can be used in the isolation of similar human proteins and in vector production. In addition, the biallelic markers shown can be used in disease diagnosis and population studies.
                                                                                                                                                                                                                             Claim 1: Page 143-175: 199pp: English.
                                                                                                                                                                                                                                                                 An isolated or purified human kinesin-like protein (HKLP) encoding polynucleotide in a sample comprises a contiguous span of at least 12 nucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human: kincsin-like protein: HKLP: KIF1: cell division: cancer: intracellular transport: neurological disorder; infertility; biallelle marker: spontaneous abortion: neonatal chromosome disorder: aneuploidy: ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a homogygosity deletion domain co-existing in the 35-position of the first chromosome short arm (1p35) in human neuroblastoma. Also described are base sequences from the 1p36 position of human neuroblastoma. Also described are base sequences (RR-1 and MASS-NB-SCH-1), which are tumour suppressor genes in human neuroblastoma. The genes are tumour suppressor genes, base sequence data of which are applicable as fumour markers and respents in studying mechanism of tumour body (ormation, and gene diagnosts of tumours as well as in developing anti-cancer drugs. AMS78787 to AMS78820 propresent PCR primers used in the exemplification of the present invention, and AMS7830 to AMS78821 prepresent sequences given in the exemplification of the present invention of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting and quantitating analyte polynucleotide in a sample, by co-amplifying analyte polynucleotide with predetermined arount of pseudo target, producing amplification products and quantifying analyte amplicons
                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for quantifying analyte polynucleotides (AP). The method comprises combining a test sample of AP with predetermined amount of a pseudo target (PT) and co-amplifying, to produce a collection of amplification products including an analyte amplicon if the sample contained AP and PT amplicon. The analyte amplicon is quantified without reference to the amount of PT amplicon and related to AP in the sample. The present sequence is a probe used in the rethod of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2001-182804/18.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The lipid transfer protein encoded by this sequence may be used to alter the composition of lipid membranes. The lipid transfer protein may also be used to create new liposomes for use as divergences and new plants which have cells with altered membranes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI: 1994-322194/40.

HELA2 has high homology to CC serine proteases. The protein is involved in or associated with regulation of cell activity and/or viability. Administration of CC recombinant HELA2 (also called testisin) is used to increase fertility. Coordinate germ cell cancers (seminoma) and is also expressed in some conversitual reancers (of colon, pancress, prostate and overy), so is a market/potential therapeutic target for cancer. The promoter/from the e.g. for gene therapy or modulation of fertility. Drugs that block activity of HELA2 should have anithmour activity (other than in testis recombinant HELA2 should have anithmour activity (other than in testis) while in testis recombinant HELA2 should stop growth of turours and mormalise sperm development (eliminating the need for orchidectomy). The furnishment of the promoter o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ouery Match 3.6%; Score 21; DB 19; Best Local Similarity 100.0%; Pred. AAF22373 to AAF22421 encode the human secreted proteins given in AAB53134
C to AAB53162. AAB53183 to AAB53231 represent more human secreted proteins
C and polypeptides homologous to them. Human secreted proteins have
C activities hased on the tissues and cells the genes are expressed in.
C Examples of activities include: immunosuppressive; antibacterial; vincide;
C inngicide; and pohthalmological. The polynucleotides and proteins can be
C used to prevent, treat or ameliorate a medical condition in e.g. humans,
mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are
C also used in diagnosing a pathological condition or susceptibility to a
pathological condition. Disorders which are diagnosed or treated include
C pathological condition. Disorders which are diagnosed or treated include
C disorders e.g. neeplasms of the breast or liver, cardiouscular
C disorders e.g. neeplasms of the breast or liver, cardiouscular
C disorders e.g. contead by becteria, viruses and fungl and ocular
C disorders e.g. corneal infection. The polypeptides can also be used to
adjug due to sunburn, to maintain organs before transplantation, for
C supporting cell culture of primary tissues, to regenerate tissues and in
C supporting cell culture of primary tissues, to regenerate tissues and in
C chemotaxis. The polypeptides can also food additive or
C charcariza and Ana63133 represent sequences used in the exemplification of
C the present invention.

this sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number is given in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene can be used to generate fusion proteins by linking to the gene can be used to generate fusion proteins by linking to the gene can be fused protein as compared to the human protein only. The invention relates to 83 novel genes and their fragments (nucleic acid sequences) AXXXVIII:XXVIIII (2007) and their fragments (nucleic candiscide sequences) AXXVIII:XXVIIII (2007) and their fragments (nucleic conditions e.g. by protein or gene therapy. Also, pathological conditions e.g. by protein or gene therapy. Also, pathological conditions can be disposed by determining the amount of the new colymucleotides. Specific uses are described for each of the 95 colymucleotides. Specific uses are described for each of the 95 colymucleotides. Specific uses are described for each of the 95 colymucleotides based on which tissues they are most highly expressed in (see AXXVIII).

CC human secreted proteins AAR53724 - AAR53777. Sequences AAR51778 -
CC human secreted proteins AAR51774 - AAR51777. Sequences AAR51778 -
CC AAR51825 represent alternative polypeptides encoded by the genes and
amino acid sequences to which they are homologous. The genes and proteins
cc have activities dependent on the itssues and cells in which they are
expressed. Examples of their activities include immunosuppressive;
cc antiarthritic; antirrhematic; antiroliferative; cytostatic cardiant;
visotropic; cerebroprotective; mostropic; neuroprotective; antibacterial;
cc virucide; funcicide; opthalmalogical; and vulnerary. The secreted
cc proteins, polymurisotides; antasynists and agonists may be useful in
cc treating, preventing and/or diagnosting diseases and disorders such as
autolamune diseases e.g. rhematoid arthritis, hyperproliferative
cc disorders e.g. neoplasms of the breast or liver, cardiovascular disorders
cc e.g. cardiac artest; cerebrovascular disorders e.g. cerebral ischaemia,
candiogenesis, nervous system disorders e.g. Alzheimer's diseases,
cc infections caused by bacteria, viruses and fund and ocular disorders
cc e.g. corneal infection. The polypeptides can also be used to aid wound
bealing and epithelial cell proliferation, to prevent skin aging due to
sunburn, to maintain organs before transplantation, for supporting cell
cc increase or decrease storage capabilities, fat content, lipid, protein,
cc polypeptides can also be used as a food additive or preservative to
components. Oligonucleotide AAC33413 - AAC3341 and peptide AAB51723 are
used in the isolation and characteris and other nutritional
cc polypucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human: secreted-protein: Immunosuppressive: antiarthritic; antirheumatic; antipressive; cyclostalic; cardiant; vasotropic; cerebroprotective; noctropic; neuroprotective; antibacterial; virucide; fungicide; opthalmalogical; vulnerary; autoimmune disease; rheumatoid arthritis; hyperproliferative disorders; cardiovascular disorder; cardiovascular disorder; cardiovascular disorder; cardiovascular disorder; altheumatoid stress; cerebrovascular disorder; nervous system disorder; Alzheimer's disease; ocular disorder; wound healing; skin aqing; ss.

                                                                                                                                                                                            ARH3231 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer associated nucleic acid molecules (N) and proteins (P), where the indecins are collectively known as colon cancer antiques. The colon cancer antiques that colon cancer antiques the colon cancer antiques the colon cancer antiques. The colon charity and vaccine production. Wand P may be used in the prevention, diagnosts and treatment of diseases associated with haspropriate P captrosts on. For example, N and P may be used to treat disorders cassociated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expression of P and distincially. N may be used to produce the colon cancer associated Ps. Committee the proteins or to supplement the patients own production of P. Additionally. N may be used to produce the colon cancer associated Ps. Committee the proteins. N and P can be used in the prevention, diagnosis and cancer colorectal carcinomas and cancers. Additional Colorectal carcinomas and cancers. Additional Colorectal carcinomas and cancers.
